Most applications require tracking of user activities, as well as logging of database changes that can be used to detect problems or errors. SQL Server offers several mechanisms to address this issue. There are two

types of SQL Server transactions: lightweight and full-featured. Transactions created by application code are called lightweight because a transaction log is not required and the records are not written to disk. A lightweight transaction does not have its own log. Operations performed by the SQL Server engine include in the transaction log, commit and rollback. The following sections discuss the data stored in the transaction log 09e8f5149f
