Source AutoCAD tools AutoCAD includes basic drafting tools, such as lines, arcs, and text tools, as well as advanced features, such as UCS, 3D views, dynamic modeling, and importing and exporting data from other applications. Common drafting tools are grouped into a variety of work areas and tools, such as DesignCenter, Drawing, Properties, WebAccess, Utilities, and Help. A typical work area includes the name of the tool and a menu of commands associated with the tool. In addition, each work area also contains one or more categories of tools, such as Architecture, Design, Engineering, and Construction. Work areas are organized into windows, which provide a space for storing user-created drawings. A drawing is placed on a page and can be printed by pressing the Page Print button. A typical user interface also includes tool palettes that provide more detailed information about a tool. A table tool palette provides information about the table component of a tool, such as what types of objects it can create and how to control the components of the table. A progress bar in a tool palette displays the status of the tool. A pick-list tool palette provides information about the pick-list component of a tool. A pick-list allows the user to select an object from a group of related objects. A dynamic modeler tool palette provides information about the dynamic modeler tool. The Properties tool palette provides information about the properties of a selected object. The WebAccess tool palette provides information about the WebAccess component of a tool. The Utilities tool palette provides information about the Utilities component of a tool. The help palette provides information about the Help component of a tool.
