The PSD or Photoshop Document is a file format that enables you to store your own image files or create new images. Photoshop handles all of your image editing and allows you to share these images with others in addition to opening them in a variety of web browsers such as Netscape and Internet Explorer. The PSD format, unlike other image formats such as GIF and JPEG, stores everything within a single file. You can also edit images in the PSD file directly without converting them to another file type. An important part of editing Photoshop documents is to work in layers. Each of these layers can have any number of blended layers and it is possible to create a stack of layers for each single image in a Photoshop document. When you use a selection tool for choosing a portion of the image that you wish to work on, the selection will reflect on all of the layers in the document. Using layers enables you to work with different parts of the image and keep a track of what you've done. Master the Photoshop Layers to Make a Compelling Portfolio In this article, you'll learn how to: Get an overview of Photoshop's Layers Use these layers to get the best out of your image, whether it's for the web, print or another medium Get started with basic layers Master the blending technique Make basic selections Review basic tutorials At the end, you'll see how to make better portfolio images, with good management and organization of their layers. **Portfolio Importing Layers** When you open Photoshop, you have a number of options to choose from. If you click the ellipsis button (...), the Open dialog box will open. Here you can select the file that you wish to open or use the file browser that comes with Photoshop. The most common reason for opening an image is that you wish to edit it. This may be for the same image you created earlier, or perhaps you want to crop it or improve the overall look. When you select a file, you are able to choose either a single image or a group of images that you wish to open together. You can also click to make an image open in Photoshop, or to create a new Photoshop document. Next, you will be presented with a blank document. There is one image in this document and you can click the Open button to open it. You will

A common method for increasing a temperature inside a patient's body is to heat a liquid, such as saline solution, in a heater element, and to circulate the liquid into the body through an infusion line or catheter. In these and other systems, it is possible for the temperature of the liquid to rise when it encounters air in the catheter. This can result in the liquid boiling and vaporizing, which creates undesired, and possibly dangerous, conditions. It is therefore desirable to monitor the temperature of the fluid inside the catheter to insure that the liquid remains in a liquid state. Prior art catheter monitoring systems provide temperature sensing devices that are placed in the catheter. These devices may include thermistors, bimetallic sensors, and thermocouples. While the thermistors have limited usefulness and the thermocouples are quite accurate, both thermocouples and thermistors are relatively expensive devices. It is therefore desirable to provide a catheter monitoring system which utilizes a temperature sensing device that is relatively inexpensive, but which provides a signal indicative of the temperature of the liquid flowing through the catheter. It is also desirable that such a system be disposable. Facile synthesis of water-soluble and highly dispersible gold nanoparticles from a novel polyfluorinated dendritic ligand. A facile, economical method for the synthesis of water-soluble and highly dispersible gold nanoparticles (AuNPs) has been developed via the dendritic ligand DA-BA (

DA-BA-3,5D was synthesized by attaching to the polyfluorinated carbon chain an amine-terminal precursor, DA-BA-NH<sub>2</sub> (DA-BA-3,5D-NH<sub>2</sub>). The as-prepared DA-BA-3,5D-NH<sub>2</sub> (DA-BA-3,5D) formed AuNPs of 2-3 nm in diameter upon reaction with HAuCl<sub>4</sub>. The hydrophobic fluorinated dendrimer played a key role in creating highly dispersed and stable colloidal AuNPs, as demonstrated by UV-vis, TEM

, more comprehensive and timely CD4 cell count testing among ART-treated patients at the point of switch to second-line ART can be used to more accurately ascertain changes in CD4 cell count over time. However, this approach may lead to delays in switching to second-line ART and thus would likely result in worse outcomes. **\*\*Competing interests\*\*** The authors declare that they have no competing interests. **\*\*Authors' contributions\*\*** BBN designed the data collection tools, performed the analysis and drafted the manuscript. Whether Wal-Mart would be willing to reduce shipping rates for a select number of products. 2. Re: The National Department of Commerce report on the increase in fuel prices during the past six months. 3. Re: The chairman of the Federal Energy Regulatory Commission's opinion about the allocation of pipeline capacity between interstate and intrastate transport. Below are our responses: 1. From a business perspective, it makes sense for us to assume that we should not sell below cost to any customer. We do not want the perception that we are getting away with selling products below cost to any customer. However, if we need to sell to a customer at a pre-determined discounted price to meet their requirements, we do have the capability to do so. Generally speaking, we do not want to sell below cost because of our desire to increase our market share. 2. A spreadsheet of fuel price increases is attached. You can use this document or the attached report to determine the price of fuel over
